

Understanding that further development and availability of the BPL technologies would greatly benefit the everyday consumer, certain steps must be taken to ensure the development of other technologies is not hindered. Relaxing the rules that govern BPL technologies would greatly affect the development of other communication abilities. Considering that many communication advances have stemmed from the "amateur" (using this term loosely) experimenter/developer, it would be damaging to the future of the communication industry to interfere further with the already tightly restricted Amateur bands. As a Communication/Electronics Maintenance Chief for the United States Marines I get to see first hand the effects of radiation currently emitting from power lines. To further increase these emissions would effect more than just the future of our Comm. technology.

Thank you for your time,

Chris King
Sgt, USMC
